

Project Initialization and Planning Phase

Date	12 August 2026
Project Title	AI Career Pulse: Decoding the Job Market

Project Proposal (Proposed Solution) template

The project proposal sets out a solution for dealing with a particular problem; it has a well-defined aim, a clearly established scope, and a succinct problem statement, and the proposed solution then describes the method to be used, the main features, and the resource requirements, such as hardware, software, and data resources.

Project Overview

Objective

The main aim of the project is to analyse data concerning jobs and artificial intelligence and to create an interactive Tableau dashboard which will help students and newcomers to understand things such as job demand, trends in salaries, the skills required, the level of experience needed and other factors that affect opportunities in AI careers.

Scope

The project involves the use of Tableau to analyse the existing AI job-market dataset. It will look at job roles, job categories, salaries, skills, experience levels, education requirements, locations, remote work, industries, company size, job demand and other job-market indicators. Visual insights and recommendations will be provided based on the data available. The project will not be used to predict any individual's future employment or ensure particular career results.

Problem Statement — Description

Students and new entrants who are entering the job market in the field of AI usually have difficulty in working out which AI positions are in demand, what skills employers want, what salary ranges are available, and in which locations or industries better opportunities can be found. This information is hard to compare since the AI job market is always changing and includes a great many different roles and requirements.

Impact

Students and new entrants who are entering the job market in the field of AI usually have difficulty in working out which AI positions are in demand, what skills employers want, what salary ranges are available, and in which locations or industries better opportunities can be found. This information is hard to compare since the AI job market is always changing and includes a great many different roles and requirements.

Approach

The way to proceed is to look at the AI job-market dataset and produce interactive visualisations using Tableau. The dataset will be prepared for analysis during the specified data-cleaning phase. Once this is done, appropriate KPIs, charts, filters, and dashboards will be developed in order to detect patterns in job demand, salaries, skills, experience, industries, and locations. The insights obtained in this way will then be applied to make useful observations and recommendations about careers.

Key Features

- Interactive Tableau dashboard
- Job-demand analysis
- Salary analysis
- AI job-role comparison
- Skills-demand analysis
- Experience-level analysis
- Location-wise job analysis
- Industry-wise analysis
- Interactive filters
- KPI cards and visual summaries
- Key findings and career-oriented recommendations

Section	Details
Overview	Tableau-based analysis of AI job-market trends for students and freshers.
Objective	Identify AI job demand, salaries, skills, and career opportunities.
Scope	Roles, salaries, skills, experience, locations, industries, and demand.
Problem	Students struggle to compare AI roles, skills, salaries, and opportunities.
Impact	Helps students make informed career and skill-development decisions.
Solution	Analyze job data and create an interactive Tableau dashboard.
Features	KPIs, filters, job/salary/skill analysis, comparisons, and recommendations.
