

Data Collection and Preprocessing Phase

Date	12 August 2026
Project Title	AI Career Pulse: Decoding the Job Market

Data Exploration and Preprocessing

Section	Work Completed / Findings
Data Overview	The dataset contains 1,500 AI job-market records and 25 variables in CSV format. It covers job roles, categories, experience, education, salaries, locations, remote work, company size, industries, skills, demand, growth, benefits, and job indicators.
Data Cleaning	No missing values were found and no duplicate rows or duplicate job IDs were identified.
Data Transformation	The existing categorical and numerical fields are retained for Tableau analysis. Useful calculated measures can be created later in Tableau when required for specific visualizations.
Data Type Conversion	Data types were reviewed. Numerical fields are stored as numeric values, while categorical fields are stored as text. Posting year and month are numeric fields and can be used to construct time-based analysis when required.
Column Splitting and Merging	The dataset already contains separate fields for job title, category, city, country, experience, salary, industry, and other major analytical dimensions.
Data Modeling	The dataset is a single flat table, so no table relationships are required. Existing fields can be used directly for Tableau dimensions, measures, filters, and calculated fields.
Save Processed Data	A validated copy of the dataset has been saved for the next stage of Tableau analysis.
